MODULE 2: SRS Document

1

Session -12

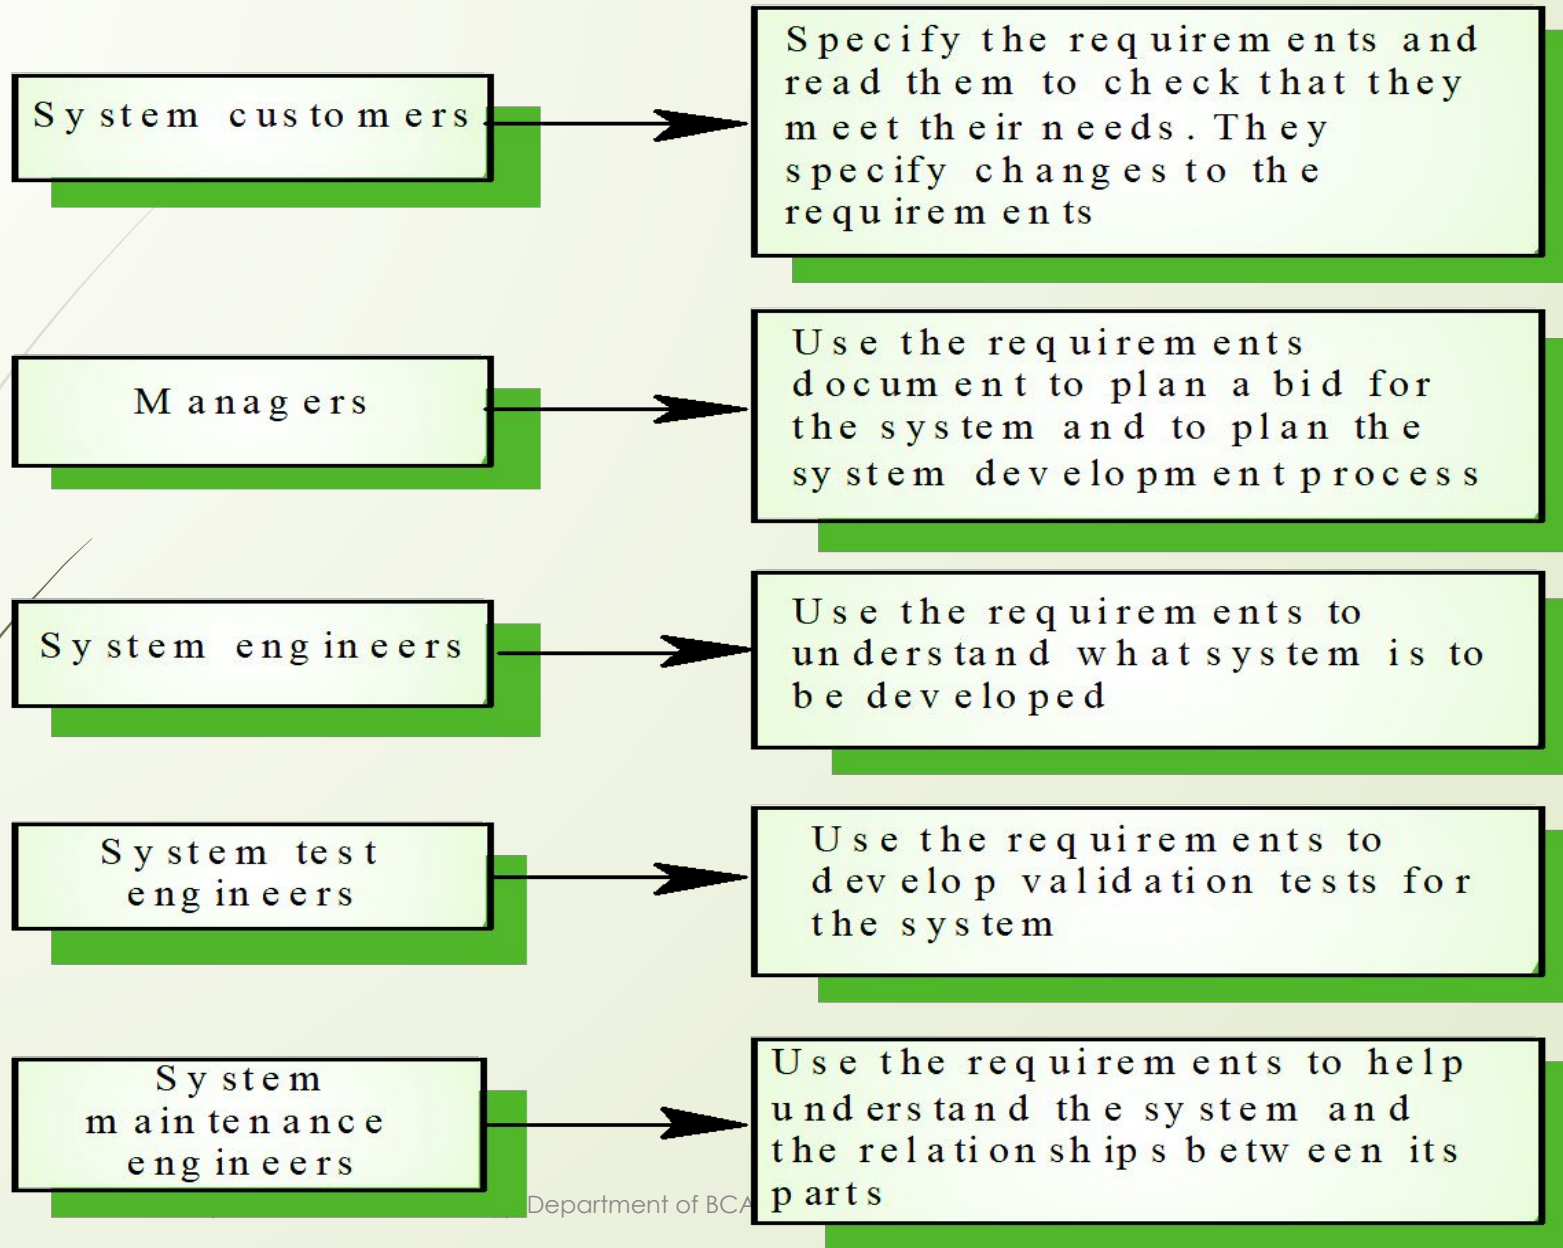

2

□ Software Requirements Specification (SRS) Document

SRS Document

3

- ❑ The SRS (software requirements specification) document is the official statement of what the **system developers should implement** in software system.
- ❑ It includes both the **user requirements** for a software system and a detailed specification of the **system requirements**.
- ❑ In some cases, the user requirements, and the system requirements **may be integrated** into a single description.
- ❑ Should include both a definition and a specification of requirements
- ❑ It is **NOT** a design document. As far as possible, it should set of **WHAT** the system should do rather than **HOW** it should do it.

Users of a requirements document

IEEE requirements standard

- This is a generic structure that must be instantiated for specific systems

1. Introduction

- 1.1 Purpose of the requirement document
- 1.2 Scope of the product
- 1.3 Definitions, acronyms, and abbreviations
- 1.4 References
- 1.5 Overview of the remainder of the document

2. General description

- 2.1 Product perspective
- 2.2 Product functions
- 2.3 User characteristics
- 2.4 General constraints
- 2.5 Assumptions and dependencies

3. Specific requirements

This section is the most substantial part of the document and covers functional, non-functional and external interface requirements. The structure of this section varies from organizations to organization.

4. Appendices

5. Index

Suggested SRS Document Structure

6

1. **Preface:** This should define the expected readership of the document and describe its version history, and a summary of the made in each version.
2. **Introduction:** This should describe the need for the system. It should briefly describe its functions and explain how it will work with other systems. It should describe how the system fits into the overall business or strategic objectives of the organization.
3. **Glossary:** This should explain the technical terms used in the document.
4. **User requirements definition:** This section provides the user requirements describes in natural language, diagrams or other notations that are understandable to the customers. Product and process standards which must be followed should be specified.
5. **System architecture:** This section should present a high-level description of the system showing the distribution of functions across system modules. Architectural components that are reused should be highlighted.
6. **System requirements specification:** This should describe the functional and non-functional requirements in more detail.
7. **System models:** This section should contain one or more system models characterising the system, its components, and its environment. These might be behavioural models, structural models and data models
8. **System evolution:** This should describe the anticipated changes due to hardware evolution, changing user and business needs, etc.
9. **Appendices:** This section should provide additional detail information related to item provided in the above sections.
10. **Index:** An alphabetic index to the document may be included.

□ Case Study/ Sample SRS

THANK YOU
