

1. Login to AWS Console

1. Open the AWS website: <https://aws.amazon.com>
2. Click **Sign In to the Console**.
3. Enter your **AWS username and password**.
4. After login, you will reach the **AWS Management Console Dashboard**.

2. Open RDS Service

1. In the **search bar** at the top of the console, type **RDS**.
2. Click **RDS (Relational Database Service)** from the services list.
3. The **RDS Dashboard** will open.

3. Create a New Database

1. Click **Create Database** button.
2. Choose **Standard Create** (recommended for learning).

4. Select Database Engine

1. Under **Engine options**, choose **MySQL**.
2. Select the **MySQL version** (default is fine for practice).

5. Choose Template

Under **Templates**, select:

Free Tier (recommended for students and practice)

6. Configure Database Settings

Enter the following details:

DB Instance Identifier

Example : mydatabase

Master Username

Example: admin

Master Password

Enter a strong password and confirm it.

Example:

Admin@12345

7. Instance Configuration

Leave the default settings for practice:

DB instance class: db.t3.micro (Free tier eligible)

8. Storage Settings

Set the following:

Storage Type: General Purpose (SSD)

Allocated Storage: 20 GB (default)

9. Connectivity Settings

Configure the network.

VPC: Default VPC

Public Access: Select **Yes** (important for connecting from your computer)

10. Database Authentication

Keep **Password authentication** (default).

11. Additional Configuration

Scroll down to **Additional Configuration**.

Enter a **Database Name**.

Example: studentdb

12. Create Database

Create Database

AWS will start creating the RDS instance.

13. Check Database Status

1. Go to **RDS Dashboard** → **Databases**.
2. Wait until **Status** = **Available**.

14. Get Endpoint for Connection

1. Click your database name.
2. Find the **Endpoint & Port**.
Example:

mydatabase.abc123xyz.us-east-1.rds.amazonaws.com

Port: 3306

This is used to connect to MySQL.
